ABSTRACT OF THE DISCLOSURE

In a method of evaluating a piezoelectric field, a non-destructive spectrometry of piezoelectric fields is semiconductor heterojunction using a in performed a technique different from PR spectroscopy. In the method, at first, first and second absorption spectra are measured by irradiating infrared light to a sample with first and second angles, respectively. Then, a peak position of an absorption band having incident-angle dependent intensity is specified based on the first and second absorption Thus, the piezoelectric field strength is spectra. obtained based on an equation of energy level. The relationship between the represents a equation level electron energy and an piezoelectric field corresponding to the peak position.
